which the codons which are most frequently used by the chosen non-human host were selected. In this case, it is yeast cells (LL20; Leu2-3; 112, His 3-11, 15). The synthetic HSA gene was assembled from 24 cligonucleotide blocks. HSA is used in therapy for the treatment of hypovolaemia, shock and hypoalbuminaemia. It is also used as an additive in perfusion liq. for extracorporeal circulation and as an experimental antigen. (Updated on 25-MAR-2003 to correct PA field.) % Query Match Length I

Score

Result No.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Sequence 18, Application US/09633041
Sequence 18, Application US/09633041
Publication No. US20030125247A1
GENERAL INFORMATION:
APPLICANT: Rosen, Craig A.
APPLICANT: Reselvine, William A.
TITLE OF INVENTION: Albumin Fusion Proteins
FILE REFERENCE: PF545
CURRENT APPLICATION NUMBER: US/09/833,041
CURRENT FILING DATE: 2001-04-12
PRIOR APPLICATION NUMBER: 60/229,358
PRIOR APPLICATION NUMBER: 60/226,931
PRIOR FILING DATE: 2000-12-21
                                                                                                                                                                                            SEQUENCE DESCRIPTION: SEQ ID NO: 26
   FILING DATE: 19-DEC-1996
INFORMATION FOR SEQ ID NO: 26:
SEQUENCE CHARACTERISTICS:
LENGTH: 585 amino acids
TYPE: amino acid
STRANDEDNESS: <Unknown>
TOPOLOGY: linear
MOLECULE TYPE: protein
HYPOTHETICAL: NO
ANII-SENSE: NO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to the treatment, prevention or amelioration of a disease or disorder associated with: aberrant B lymphocyte stimulator (BLyS), BLyS receptor expression or activity; cells of hamatopoietic origin, or proliferative disease; and reducing, inhibiting or stimulating immunoglobulin production, B cell proliferation and graft rejection involving administration of BLyS binding polypeptides are used in the treatment, prevention amelioration of diseases such as immune system diseases, proliferative diseases, diseases of cells of hematopoietic origin, graft rejection, hypergammaglobulinaemia, blood clotting diseases, inferamia, and neurodegenerative diseases. The present sequence is a protein described

The present invention relates to albumin fusion proteins comprising a the albumin fusion proteins are useful for treating, preventing, or HA).

The albumin fusion proteins are useful for treating, preventing, or ameliorating various disorders. Such disorders include immune disorders, and incorders, include immune disorders, autoimmune disorders, lood-related disorders, respiratory disorders, neurological disorders, endortine disorders, reproductive disorders, neurological disorders, endortine disorders, reproductive disorders, astrointestinal disorders, infectious disease, and wound healing. Therapeutic proteins can be stabilised to extend shelf infe and/or retain the proteins can be stabilised to extend shelf the protein to albumin or its fragment or variant. In addition the use of albumin fusion proteins reduces the need to formulate protein solutions with large excesses of carrier proteins to prevent loss of therapeutic protein due to factors such as binding to the container. The extension of shelf life was tested by measuring biological activity (Nb2 cell protein remaining after incubation in cell culture media for up to 3 weeks. At week 3 there was still approximately 95% cell proliferation compared to no activity of unfused hGH. The present sequence represents the mature form of HSA which can be used to produce the albumin fusion mature of HSA which can be used to produce the albumin fusion by proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240
                                                                                                                                                                                                                                                                                                                                                New albumin fusion proteins with extended shelf life, useful for treating leukemia, warts, hepatitis, multiple sclerosis and AIDS, comprises therapeutic protein fused to albumin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         뉴
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention related to a method for testing cancer cells. The method is useful for measuring human cancer cell proliferation, particularly for determining the potential for inhibiting cancer cells proliferation using albumin-derived peptides. The invention is also useful for drug screening assays, as well as for evaluating biopsied tumours. The present sequence is human serum albumin (HSA) related to the invention
                                                                                                                                                                360

                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an albumin fusion protein (I) comprising a therapeutic protein: X and (a fragment or variant of) albumin comprising a the fully defined sequence in ABB79006 of 585 amino acids, (where the fragment or variant has albumin or therapeutic protein: X activity). (I) can have cytostatic, anorectic, immunosuppressive, antitheumatic, antithriut and psoriatic activities.

Albumin fusion proteins are stabilised therapeutic proteins e.g. antibodies to C5, C242 and CD80 useful for treating various diseases and disorders such as non-Hodgkin's lymphoma, cancer, obseity, transplant rejection, type I diabetes mellitus, rheumatoid arthitis and psoriasis. Fusing albumin to therapeutic proteins stabilises the therapeutic protein stabilises the invitro or in vivo biological activity. It also reduces the need to formulate protein solutions with large excesses of carrier proteins to prevent loss of the interpretation proteins due to factors such as binding to the container. The fusion proteins are easily dispensed with a simple formulation requiring minimal post storage manipulation. The fusion of therapeutic proteins sequence represents the mature human albumin (HA) protein which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to albumin fusion proteins comprising therapeutic protein and human albumin (HA). The albumin fusion proteins are useful in the treatment, prevention, diagnosis, and/or detection of diseases, disorders such as immune system disorders (transplant rejection); blood related disorders (myocardial infarction); hyperproliferative disorders (childhood acute myeloid leukaemia); renal disorder (glomerulonephiritis); cardiovascular disorders (arrhythmiss); respiratory disorders (non-allergic thinitis); neurological diseases (Alzheimer's disease); endocrine disorders (precytochroma); reproductive system disorders (syphilis); infectious diseases (measles); gastrointestinal disorders (irritable bowel syndrome) and wound healing. The albumin fusion proteins are also used in the treatment of metastatic renal call carcinoma, malignant melanoma and HIV (human immunodeficiency virus) infection. Nucleic acid encocding albumin fusion protein is useful in gene therapy. The present sequence is human albumin (HA) protein
                                                                                                                                                                                                                                                                                                                                                                                               Albumin fusion proteins comprising a therapeutic protein and albumin, useful in the treating metastatic renal cell carcinoma, metastatic melanoma, malignant melanoma, renal cell carcinoma, HIV (human immunodeficiency virus) or infection.
                                                                                                                                                                                                                                                                                                                         Turner AJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to albumin fusion proteins comprising therapeutic protein and human albumin (HA). Therapeutic protein fused to albumin have an extended shelf-life. The albumin fusion proteins are useful in the treatment, prevention, diagnosis and/or detection of diseases, disorders such as immune system disorders (e.g. transplant rejection), blood disorders (e.g. myocardial infarction), hyperproliferative disorders (e.g. childhood acute myeloid leukaemia), renal disorders (e.g. childhood acute myeloid leukaemia), renal disorders (e.g. respiratory disorders (e.g. non-allergic rhinitis), neurological diseases (e.g. Alzheimer's disease), endocrine disorders (e.g. phocytochroma), reproductive system disorders (e.g. syphilis), infectious diseases (e.g. measles), gastrointestinal disorders (e.g. irritable bowel syndrome) ameasles), gastrointestinal disorders (e.g. irritable bowel syndrome) and wound healing. Nucleic acids encoding albumin fusion protein is used in gene therapy. The present sequence is human albumin (HA) protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Albumin fusion proteins comprising a therapeutic protein and albumin, useful in the treating immune system disorders (e.g. transplant rejection), blood related disorders (e.g. myocardial infarction) and hyperproliferative disorders.

The invention relates to human albumin (HA) fusion proteins and their corresponding nucleic acid sequences. Therapeutic proteins fused to albumin or its fragments have an extended shelf-life. The albumin fusion proteins are useful in the treatment, prevention, diagnosis, and/or detection of diseases, disorders such as immune system disorders (e.g. transplant rejection), blood related disorders (e.g. myocardial infarction), hyperproliferative disorders (e.g. childhood acute myeloid infarction), hyperproliferative disorders (e.g. childhood acute myeloid cleukaemia, metastatic renal cell carcinoma, metastatic melanoma, and lighant melanoma, ranal cell carcinoma, renal disorders (e.g. arrhythmias), candiovascular disorders (e.g. arrhythmias), capiratory disorders (e.g. non-allergic rhinitis), neurological diseases (e.g. reproductive system disorders (e.g. syphilis), infectious diseases (e.g. measles), gastrointestinal disorders (e.g. iritable bowel syndrome), HIV chuman immunodeficiency virus) infection and wound healing. Nucleic acide encoding albumin fusion protein is used in gene therapy. The present

The present invention relates to albumin fusion proteins, which comprise a therapeuric protein and albumin. The present sequence is the protein sequence for mature human serum albumin (HA), which was used to generate the fusion proteins of the present invention. The albumin fusion proteins are useful in the treatment, prevention, diagnosis, and/or detection of diseases Adisorders such as immune system disorders (e.g. transplant rejection), blood related disorders (e.g. myocardial infarction) hyperproliferative disorders (e.g. childhood acute myeloid leukemia), renal disorders (e.g. childhood acute myeloid leukemia), arrhythmias), respiratory disorders (e.g. non-allergic rhinitis), neurological diseases (e.g. Alzheimer's disease), endocrine disorders (e.g. pheocytochroma), reproductive system disorders (e.g. syphilis),

The present sequence represents human albumin protein. The specification describes a method for the continuous detection of ischemic states. The method comprises detecting and quantifying the existence of an alteration of the serum protein albumin. The method comprises contacting an alteration biological sample containing albumin from the patient with an excess quantity of a metal ion salt, where the metal ion binds to the Vterminus of naturally occurring human albumin, to form a mixture containing bound metal ions bound metal ions bound to the albumin, to form a mixture containing bound metal ions bound to the albumin Vterminus. The amount of bound metal ions is correlated to a known value to determine the occurrence or non-occurrence of an ischemic event. The methods are useful for detection of ischemic states. The methods are also useful for distinguishing perioperative ischemia from ischemia caused by , amongst other things, myocardial infarctions and progressive coronary artery disease
                       i for the continuous detection of ischemic states comprises and quantifying the existence of an alteration of the serum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Length 585;

The method relates to a method of recombinantly producing human serum albumin (HSA) in yeast by altering the coding sequence of HSA to comprise a yeast codon bias. The complete HSA gene (AAA10091) was generated as three synthetic fragments (AAA10092-A10094) joined by recombinant DNA technology. Each HSA fragment was synthesised from overlapping oligonucleotide fragments that were extended. This sequence represents the complete sequence of the HSA encoded by the human gene with a yeast codon bias. The invention also covers a recombinant expression vector, yeast host cells carrying the recombinant expression vector, process for producing human serum albumin in the yeast host cell,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The cDNA given in AAQ98695, which encodes HSA (AAR80301), was subjected to site-directed mutagenesis to investigate the role of endoproceases in the generation of a 45 kDa albumin fragment obtd. when the cDNA is expressed in S. cerevisiae. Mutations were: R410A; L407A, L408V, V409A; and R410A, K413Q, K414Q. The latter set of mutations, especially. Improved stability of HSA to yeast Yap3p proteclytic cleavage, allowing increased produ. of recombinant HSA. (Updated on 25-MAR-2003 to correct
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         VHTECCHGDLLECADDRADLAKYICENODSISSKLKECCEKPLLEKSHCIAEVENDEMPA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ò
                                                                                                                                                                                                                                                                                                                                                                Pragments A-C of HSA are expressed as fusion proteins with the signal peptide of E. coli alkaline phosphatase. The fragments are selected for their specific properties. The C-terminal truncated fragment, B, does not bind long-chain fatty acids but does bind to various medicines at the central region. The N-terminal truncated fragment, C, has good stability in protein folding. The central segment, A, has characteristics of both B and C. See also ARQ06096. (Updated on 25-MAR-2003 to correct PD field.) (Updated on 25-MAR-2003 to correct PP field.)
